

WriteUp:

So here we create well-structured output for their API client using Postman for Bangalore city to get a detailed report on the weather in a quicker way.

We use Postman and REST API for this.

So first we open a tab in postman and use get method and give the link as <https://api.openweathermap.org/data/2.5/weather> and in params we add q as Bangalore and appid as e4f6a7cd72f235315d2262849f987aca. We get this appid from the openweathermap via creating account and choose free service.

Then the new link will be as

<https://api.openweathermap.org/data/2.5/weather?q=Bangalore&appid=e4f6a7cd72f235315d2262849f987aca>

And now send to get result and we got the result.

For test we also use AI available in postman . we go to Tests and use scriptwithpostbot and Add tests to this request and we got the Test code.
